

Prima Frame

Retractor system for direct anterior approach (DAA) in hip surgery

Prima Frame

Efficient tissue retraction and intuitive use

Wound retractor for direct anterior approach (DAA)

The Prima Frame has been specially developed for direct anterior approach in hip surgery. It is used immediately after preparation of the surgical approach and enables **self-retaining** soft tissue retraction. This improves visibility and working conditions in the surgical field – without the need for additional staff.

Precision in access

The infinitely variable retraction function ensures an ideal opening of the access site. It provides excellent access to the hip area, particularly with anterior access.

Blade **blunt** vs. Blade **pointed**

Selection of Blades in 4 different lengths
– available with **blunt** or **pointed teeth**.

Material: stainless steel **Weight:**
547 g
Length: 265 mm x 175 mm
Wound opening up to 170 mm

Prima Frame

Function & Benefits

Handling & Safety

The system consists of just **four** individual parts and can be assembled in seconds. The Blades are simply slid onto the frame and securely fixed in place by the integrated spring mechanism.

For the procedure, the retractor frame is preassembled and set to its minimum size so that the hooks are positioned close together. It is then inserted into the surgical access and carefully expanded until the surgical field is optimally exposed..

Function & Benefits

The spreading mechanism allows for precise opening of the access site and improves access to the hip area. The surrounding tissue is protected, whilst the **self-locking**, stable design ensures safe use.

No additional surgical staff are required to hold the retractor – this significantly **reduces the workload for the entire team**.

- ➡ For efficient procedures
- ➡ High safety and comfort in daily surgical procedures

Simple assembly in just **two** steps
